Enable admin share using the registry

From the computer you'd like to enable the admin share, click Start or Cortana and immediately type "cmd". From the list of results, right-click Command Prompt and select Run as administrator.

Copy and paste the following command into the Command Prompt window and hit enter.

REG ADD HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\system /v LocalAccountTokenFilterPolicy /t REG_DWORD /d 1 /f

Reboot the computer.

You can now browse to the computer's admin share using a local administrative account of the machine. For example:

Voor PC1

\\pc2\d$

\\pc2\e$
